13_S3

2023-03-06

13 S3

13.1 Introduction

[1] "a" "b" "c"

```
f <- factor(c("a", "b", "c"))

typeof(f)

## [1] "integer"

attributes(f)

## $levels

## [1] "a" "b" "c"

##

## $class

## [1] "factor"

unclass(f)

## [1] 1 2 3

## attr(,"levels")</pre>
```

```
ftype(print)
## [1] "S3"
                "generic"
ftype(str)
## [1] "S3"
                "generic"
ftype(unclass)
## [1] "primitive"
print(f)
## [1] a b c
## Levels: a b c
print(unclass(f))
## [1] 1 2 3
## attr(,"levels")
## [1] "a" "b" "c"
time <- strptime(c("2017-01-01", "2020-05-04 03:21"), "%Y-%m-%d")
str(time)
## POSIX1t[1:2], format: "2017-01-01" "2020-05-04"
str(unclass(time))
## List of 11
## $ sec : num [1:2] 0 0
## $ min : int [1:2] 0 0
## $ hour : int [1:2] 0 0
## $ mday : int [1:2] 1 4
## $ mon
          : int [1:2] 0 4
## $ year : int [1:2] 117 120
## $ wday : int [1:2] 0 1
## $ yday : int [1:2] 0 124
## $ isdst : int [1:2] 0 1
## $ zone : chr [1:2] "PST" "PDT"
## $ gmtoff: int [1:2] NA NA
s3_dispatch(print(f))
## => print.factor
## * print.default
```

```
ftype(t.test)
## [1] "S3"
                  "generic"
ftype(t.data.frame)
## [1] "S3"
                 "method"
weighted.mean.Date
## Error in eval(expr, envir, enclos): object 'weighted.mean.Date' not found
s3_get_method(weighted.mean.Date)
## function (x, w, ...)
## .Date(weighted.mean(unclass(x), w, ...))
## <bytecode: 0x000001d906154f18>
## <environment: namespace:stats>
When using s3_dispatch()
=> method exists and is found by UseMethod().
-> method exists and is used by NextMethod().
* method exists but is not used.
Nothing (and greyed out in console): method does not exist.
13.2.1 Exercises
  1. Describe the difference between t.test() and t.data.frame(). When is each function called?
ftype(t.test)
## [1] "S3"
                  "generic"
s3_dispatch(t.test(1:10, y = c(7:20)))
##
      t.test.integer
##
      t.test.numeric
## => t.test.default
ftype(t.data.frame)
## [1] "S3"
                 "method"
```

```
s3_dispatch(t(data.frame(a=1:5, b = 6:10)))
## => t.data.frame
## -> t.default
s3_dispatch(t.data.frame(data.frame(a=1:5, b = 6:10)))
##
      t.data.frame.data.frame
##
      t.data.frame.default
t.test is a generic while t.data.frame is a method. t.test gets called first since it is a generic and then it
finds the right implementation for the job. t.data.frame is called once the generic determines it is the correct
method by performing method dispatch.
  2. Make a list of commonly used base R functions that contain . in their name but are not S3 methods.
ftype(read.csv)
## [1] "function"
ftype(as.character)
## [1] "primitive" "generic"
ftype(all.equal)
## [1] "S3"
                   "generic"
ftype(file.copy)
## [1] "internal"
ftype(format.info)
## [1] "internal"
ftype(is.na)
## [1] "primitive" "generic"
ftype(Sys.info)
```

3. What does the as.data.frame.data.frame() method do? Why is it confusing? How could you avoid this confusion in your own code?

[1] "internal"

```
ftype(as.data.frame.data.frame)
## [1] "S3"
                "method"
s3_dispatch(as.data.frame.data.frame(mtcars))
##
      as.data.frame.data.frame.data.frame
##
      as.data.frame.data.frame.default
as.data.frame.data.frame(mtcars)
##
                       mpg cyl disp hp drat
                                                  wt qsec vs am gear carb
## Mazda RX4
                       21.0
                              6 160.0 110 3.90 2.620 16.46
## Mazda RX4 Wag
                       21.0
                              6 160.0 110 3.90 2.875 17.02
                                                                    4
                                                                         4
                                                            0
                                                               1
## Datsun 710

## Volvo 142E
                       21.4
                              4 121.0 109 4.11 2.780 18.60
s3_dispatch(as.data.frame.data.frame(matrix(1:25, nrow = 5)))
##
      as.data.frame.data.frame.matrix
##
      as.data.frame.data.frame.integer
##
      as.data.frame.data.frame.numeric
##
      as.data.frame.data.frame.default
```

```
as.data.frame.data.frame(matrix(1:25, nrow = 5))

## Error in if (i > 1L) class(x) <- cl[-(1L:(i - 1L))]: missing value where TRUE/FALSE needed

s3_dispatch(as.data.frame(matrix(1:25, nrow = 5)))

## => as.data.frame.matrix

## * as.data.frame.integer

## * as.data.frame.default

as.data.frame(matrix(1:25, nrow = 5))

## V1 V2 V3 V4 V5

## 1 1 6 11 16 21

## 2 2 7 12 17 22

## 3 3 8 13 18 23

## 4 4 9 14 19 24

## 5 5 10 15 20 25
```

It checks if the object is a data.frame and coerces it if possible and then attempts to cast it as a data.frame Easier to just use the generic instead of the specific method, let method dispatch do the work for you

4. Describe the difference in behaviour in these two calls.

```
set.seed(1014)
some_days <- as.Date("2017-01-31") + sample(10, 5)
some_days

## [1] "2017-02-07" "2017-02-05" "2017-02-06" "2017-02-10" "2017-02-04"

s3_dispatch(mean(some_days))

## => mean.Date
## * mean.default

class(some_days)

## [1] "Date"

mean(some_days)

## [1] "Date"
```

```
s3_dispatch(mean(unclass(some_days)))

## mean.double
## mean.numeric
## => mean.default

class(unclass(some_days))

## [1] "numeric"

str(unclass(some_days))

## num [1:5] 17204 17202 17203 17207 17201

mean(unclass(some_days))

## [1] 17203.4
```

The first one calculates mean using the mean.Date method since it sees the class is "Date". In the second class is stripped so it becomes a numeric and this causes the mean.default method to be used.

5. What class of object does the following code return? What base type is it built on? What attributes does it use?

```
x <- ecdf(rpois(100, 10))
x

## Empirical CDF
## Call: ecdf(rpois(100, 10))
## x[1:18] = 2, 3, 4, ..., 18, 19

class(x)

## [1] "ecdf" "stepfun" "function"

str(x)

## function (v)
## - attr(*, "class") = chr [1:3] "ecdf" "stepfun" "function"
## - attr(*, "call") = language ecdf(rpois(100, 10))

typeof(unclass(x))</pre>
```

[1] "closure"

x is class ecdf, with two more classes of stepfun and function. it's base class is a closure (function). The attribute it uses is the expression used when it was created rpois(100,10).

6. What class of object does the following code return? What base type is it built on? What attributes does it use?

```
x \leftarrow table(rpois(100, 5))
##
## 1 2 3 4 5 6 7 8 9 10
## 7 5 18 14 15 15 14 4 5 3
class(x)
## [1] "table"
typeof(x)
## [1] "integer"
str(x)
## 'table' int [1:10(1d)] 7 5 18 14 15 15 14 4 5 3
## - attr(*, "dimnames")=List of 1
## ..$ : chr [1:10] "1" "2" "3" "4" ...
attributes(x)
## $dim
## [1] 10
## $dimnames
## $dimnames[[1]]
## [1] "1" "2" "3" "4" "5" "6" "7" "8" "9" "10"
##
##
## $class
## [1] "table"
class(unclass(x))
## [1] "array"
Class is table. It is built on top of the base type integer. It uses the attribute dimnames
```

13.3 Classes

```
# Create and assign class in one step
x <- structure(list(), class = "my_class")

# Create, then set class
x <- list()
class(x) <- "my_class"</pre>
```

```
class(x)
## [1] "my_class"
inherits(x, "my_class")
## [1] TRUE
inherits(x, "your_class")
## [1] FALSE
# Create a linear model
mod <- lm(log(mpg) ~ log(disp), data = mtcars)</pre>

new_data.frame <- function(x, row.names = NULL){ # x is the input list</pre>
  stopifnot(is.list(x)) # Require list
  stopifnot(length(unique(lengths(x))) == 1) # Require same length vectors
  n <- unique(lengths(x))</pre>
  if(is.null(row.names)){
    row.names <- as.character(1:n)</pre>
  } else {
    stopifnot(is.character(row.names), length(row.names) == n)
  structure(
    class = "data.frame",
    row.names = row.names
}
dat_list \leftarrow list(a = 1:5, b = 6:10)
new_data.frame(dat_list)
##
     a b
## 1 1 6
## 2 2
        7
## 3 3 8
## 4 4 9
## 5 5 10
new_data.frame(dat_list, row.names = LETTERS[1:5])
     a b
## A 1
## B 2 7
## C 3 8
## D 4 9
## E 5 10
dat_list2 \leftarrow list(a = 1:5, b = 6:11)
new_data.frame(dat_list2)
```

Error in new_data.frame(dat_list2): length(unique(lengths(x))) == 1 is not TRUE

data.frames are built on top of lists. The list contains named vectors and a row.names attribute which is optional. Each name in row.names has to be unique and each element of the list must be the same length

2. Enhance my factor() helper to have better behaviour when one or more values is not found in levels. What does base::factor() do in this situation?

```
factor <- function(x = character(), levels = unique(x)) {</pre>
  ind <- match(x, levels)</pre>
  if(any(is.na(ind))){
    cat("removing", x[is.na(ind)], "since they are not present in levels\n")
    x \leftarrow x[!is.na(ind)]
    ind <- match(x, levels)</pre>
  validate factor(new factor(ind, levels))
}
x <- c("a", "a", "b")
factor(x)
## [1] a a b
## Levels: a b
factor(x = x,
       levels = c("a", "c"))
## removing b since they are not present in levels
## [1] a a
## Levels: a c
base::factor(x = x,
       levels = c("a", "c"))
## [1] a
                  <NA>
## Levels: a c
```

In this case base::factor will convert values not present in level to NA

3. Carefully read the source code of factor(). What does it do that my constructor does not?

If any of the indexes are not an integer it stops the execution. This means an NAs from ind in the helper function will cause the function to stop. In the base function if levels are not provided, it generates levels from input. The base function handles cases of input where the input has levels not listed in the levels. It creates the vector, converts non-level values to NA and then adds the levels attribute.

4. Factors have an optional "contrasts" attribute. Read the help for C(), and briefly describe the purpose of the attribute. What type should it have? Rewrite the new_factor() constructor to include this attribute.

```
new_factor <- function(x = integer(), levels = character(), contrasts = NULL) {
   stopifnot(is.integer(x))
   stopifnot(is.character(levels))
   if(!is.null(contrasts)){</pre>
```

```
stopifnot(is.matrix(contrasts) && is.numeric(contrasts))
  }
  structure(
    х,
    levels = levels,
    class = "factor",
    contrasts = contrasts
  )
}
model3 <- glm(cbind(ncases, ncontrols) ~ agegp + C(tobgp, , 1) +</pre>
     C(alcgp, , 1), data = esoph, family = binomial())

```

C needs a mumeric matrix or a suitable function. When modeling it allows us to preset the contrasts we want to use.

5. Read the documentation for utils::as.roman(). How would you write a constructor for this class? Does it need a validator? What might a helper do?

It converts integer numbers into roman numerals. The new object is has the class "roman" Number range is 1 to 3899. It uses a basic dictionary called .romans. Constructor makes sure we have in integer input. Validator can check to make sure it's in range. Helper could round numbers to the nearest integer

```
.romans
##

13.4.3 Creating methods

13.4.4 Exercises

1. Read the source code for t() and t.test() and confirm that t.test() is an S3 generic and not an S3 method. What happens if you create an object with class test and call t() with it? Why?

```
## function (x)
## UseMethod("t")
## <bytecode: 0x000001d905c8d2b0>
## <environment: namespace:base>
s3_methods_generic("t")
## # A tibble: 6 x 4
                       visible source
##
    generic class
     <chr> <chr>
                       <lgl> <chr>
##
           data.frame TRUE
## 1 t
                               base
## 2 t
            default
                       TRUE
                               base
          gtable
## 3 t
                       FALSE registered S3method
## 4 t
          ts
                       FALSE registered S3method
        vctrs_sclr FALSE
vctrs_vctr FALSE
## 5 t
                               registered S3method
## 6 t
                               registered S3method

4. Which base generic has the greatest number of defined methods?

```
possibles <- ls("package:base")
possibles_functions <- mget(possibles, envir = baseenv())
possibles_functions <- unlist(map(possibles_functions, is_function))
possibles <- possibles[possibles_functions]
possibles_generics <- unlist(map(possibles, is_s3_generic))
possibles <- possibles[possibles_generics]
names(possibles) <- possibles
for(i in 1:length(possibles)){
    possibles[i] <- nrow(s3_methods_generic(possibles[i]))
}

possibles %>%
    as.numeric() %>%
    set_names(., names(possibles)) %>%
    sort(decreasing = T) %>%
    head()
```

```
## print format [ as.character summary ## 345 147 68 50 45 ## as.data.frame ## 37
```

5. Carefully read the documentation for UseMethod() and explain why the following code returns the results that it does. What two usual rules of function evaluation does UseMethod() violate?

```
g <- function(x) {
    x <- 10
    y <- 10
    UseMethod("g")
}
g.default <- function(x) c(x = x, y = y)

x <- 1
y <- 1
g(x)

## x y
## 1 10

g.default(x)</pre>
```

The function uses the value of x we provide and not the value set in the generic. Method dispatch takes place based on the class(es) of the first argument to the generic function or of the object supplied as an argument to UseMethod or NextMethod.

6. What are the arguments to [? Why is this a hard question to answer?

x y ## 1 1

```
ftype(`[`)

## [1] "primitive" "generic"

formals(`[`)

## NULL

s3_methods_generic("[")
