4 Subesetting

4.1 Introduction

Quiz

1. What is the result of subsetting a vector with positive integers, negative integers, a logical vector, or a character vector?

Select those elements only, select all but those elements, select all true elements, select all elements that match the name

2. What's the difference between [, [[, and \$ when applied to a list?

Takes sub lists and returns lists. extracts element from list, short hand for [[for extracting an element

3. When should you use drop = FALSE?

To maintain a data frame / matrix when subsetting instead of returning a vector

4. If x is a matrix, what does x[] <-0 do? How is it different from x <-0?

Sets all values in the matrix to zero, erases the matrix and makes it a 1 element value

5. How can you use a named vector to relabel categorical variables?

Just give a vector of the named elements you want to subset

4.2 Selecting multiple elements

4.2.1 Atomic Vectors

[1] 2.1 4.2

```
x \leftarrow c(2.1, 4.2, 3.3, 5.4)
x[c(3, 1)]
## [1] 3.3 2.1
#> [1] 3.3 2.1
x[order(x)]
## [1] 2.1 3.3 4.2 5.4
#> [1] 2.1 3.3 4.2 5.4
# Duplicate indices will duplicate values
x[c(1, 1)]
## [1] 2.1 2.1
#> [1] 2.1 2.1
# Real numbers are silently truncated to integers
x[c(2.1, 2.9)]
## [1] 4.2 4.2
#> [1] 4.2 4.2
x[-c(3, 1)]
## [1] 4.2 5.4
#> [1] 4.2 5.4
x[c(-1, 2)]
## Error in x[c(-1, 2)]: only 0's may be mixed with negative subscripts
\# Error in x[c(-1, 2)]: only 0's may be mixed with negative subscripts
x[c(TRUE, TRUE, FALSE, FALSE)]
```

```
#> [1] 2.1 4.2
x[x > 3]
## [1] 4.2 3.3 5.4
#> [1] 4.2 3.3 5.4
x[c(TRUE, FALSE)]
## [1] 2.1 3.3
#> [1] 2.1 3.3
# Equivalent to

## d c a
## 5.4 3.3 2.1
```

```
#> d c a
#> 5.4 3.3 2.1
# Like integer indices, you can repeat indices
y[c("a", "a", "a")]
## a a a
## 2.1 2.1 2.1
#> a a a
#> 2.1 2.1 2.1
\# When subsetting with [, names are always matched exactly

#> <NA> <NA>
#> NA NA

4.2.2 Lists

Using [always returns a list; [[and \$, as described in Section 4.3, let you pull out elements of a list

4.2.3 Matrices and arrays

```

2. Why does the following code yield five missing values? (Hint: why is it different from
x[NA\_real\_]?)
## [1] NA NA NA NA NA
#> [1] NA NA NA NA NA
x[NA_real_]
## [1] NA
```

```
#> [1] NA
```

NA is not applicable so it gives 5 NAs because it can't tell for each number if it is the same or not. With $x[NA_real_]$ you are pulling real NAs and they don't exist so you get NA

```
x <- outer(1:5, 1:5, FUN = "*")
x
```

## [1] 2 3 4 5 6 8 10 12 15 20
```

Upper triangle of the matrix not including the diagonal. It returns a same size matrix of T and F. Matrix subsetting with a matrix which strips the dimensionality of the matrix and makes it a 1D vector

```
dim(mtcars)
```

4. Why does mtcars[1:20] return an error? How does it differ from the similar mtcars[1:20,]?

```
## [1] 32 11
```

There's only 11 columns so mtcars [1:20] is asking for more columns than exist in the data

```
mat[i,i] <- TRUE
}
return(m[mat])
}

x <- outer(1:5, 1:5, FUN = "*")
diag(x)</pre>
```

5. Implement your own function that extracts the diagonal entries from a matrix (it should behave like diag(x) where x is a matrix).

```
## [1] 1 4 9 16 25
diag_alt(x)
```

- 6. What does df[is.na(df)] <- 0 do? How does it work? Any NA elements in the data frame are converted to 0 using a logical matrix
- 4.3 Selecting a single element

4.3.4 @ and slot()

There are two additional subsetting operators, which are needed for S4 objects: @ (equivalent to \$), and slot() (equivalent to [[). @ is more restrictive than \$ in that it will return an error if the slot does not exist. These are described in more detail in Chapter 15.

4.3.5 Exercises

```
mtcars[3,2]
```

1. Brainstorm as many ways as possible to extract the third value from the cyl variable in the mtcars dataset.

[1] 4

mtcars\$cy1[3]

[1] 4

mtcars[["cyl"]][3]

[1] 4

as.matrix(mtcars)[35]

[1] 4

as.matrix(mtcars)[[35]]

[1] 4

```
mod <- lm(mpg ~ wt, data = mtcars)
mod$df.residual</pre>
```

2. Given a linear model, e.g., mod <- lm(mpg \sim wt, data = mtcars), extract the residual degrees of freedom. Then extract the R squared from the model summary (summary(mod))

[1] 30

```
summod <- summary(mod)</pre>
summod$r.squared
